

Manual Mobile App Testing

The most important aspect of testing Mobile Devices is testing the individual application. Developing a Mobile Device Application is of utmost importance for Enterprises which requires substantial development cycles. Equally important is to test it for the overall experience and for defects.

Continuous Testing allows **end to end support for testing an Application** in a large **set of devices**,

- Installing the application in a device
- Launching the application in a device
- Manual and Automated testing

Loading an Android Application

To begin, **open a device** from the device screen. You can then start interacting with the application as if you were a real user.

Proceed by **installing the application** on the device. If the app is not on the list, upload the app package file.

Begin by launching the application, in this example "eribank" application is launched.

Once the application has launched, you can start interacting with it
